Starting off, the receiver took a very long time to locate the satellites, so we headed to the center of campus thinking it would probably be the best way to go. We started in Mathey courtyard and eventually the GPS located some satellites. I had already loaded the coordinates into the waypoint system of the GPS (first I had to convert from the decimal form to minutes and seconds), so then I turned on the navigation screen and it pointed SE. We headed past Jadwin and Denunzio and eventually crossed a road and found the storage container at a small pond. The receiver still read that I was 15 ft from the container, but we then realized that the receiver also noted that the degree of accuracy was 40-50 ft using the satellites that the receiver had located. Our journey was complete.
